Real Time Monitoring

Visibility to your shipments anytime, anywhere

At OOCL Logistics we want our customers to be able to stay up-to-date with the status and whereabouts of their shipments. By launching our latest innovative product, Real Time Monitored Trucking Service (RTM Trucking), we are giving our customers the ability to access real-time updates on their shipments anytime, anywhere, at every transit stage so as to help put their minds at ease.

By taking advantage of our new computer system 'RT-Link', our customers can access our online platform 'MyPodium-Domestic' for real-time updates such as:

• Precise locations of cargoes and actual routes presented in digital map format
• Accurate arrival and departure times at various locations along the route
• Cargo photographs and digital signatures at delivery
• Additional useful details including container and seal numbers

With these updates they will have timely and accurate transportation milestones and a complete set of Key Performance Indicators (KPIs) for reviewing the performance of their supply chain.

Through RTM Trucking, the updates received by our customers will not only be in text format but also in the form of photo images which can serve as proof of the status of goods at various stages of transport. The photographs of the goods can also facilitate supply chain auditing.

As an added benefit, digital signatures from recipients of the goods on-site can help speed up the processing of sales and payment collection of goods sold and delivered.

RTM Trucking is another innovative product by OOCL Logistics helping customers save time and cost, and introduces a new mode of operation to improve efficiency in the logistics industry.
